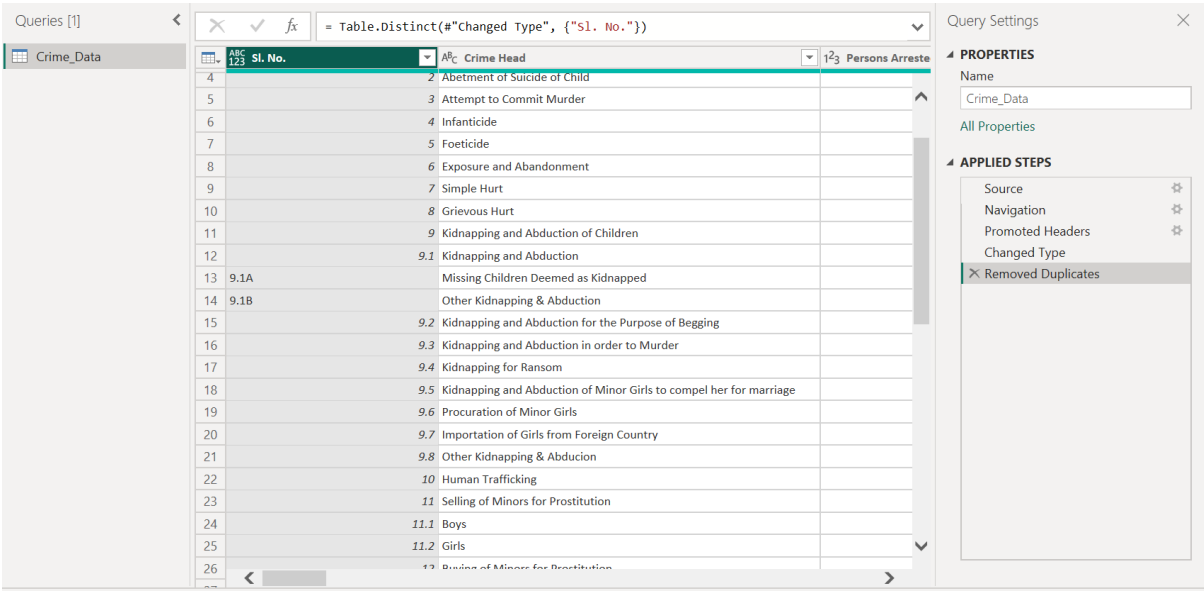
TASK 2 – DATA CLEANING (POWER QUERY)

- **Detect and remove duplicates or missing values.**
- **Standardize column names and data types.**
- **Perform necessary transformations (split, merge, replace values).**

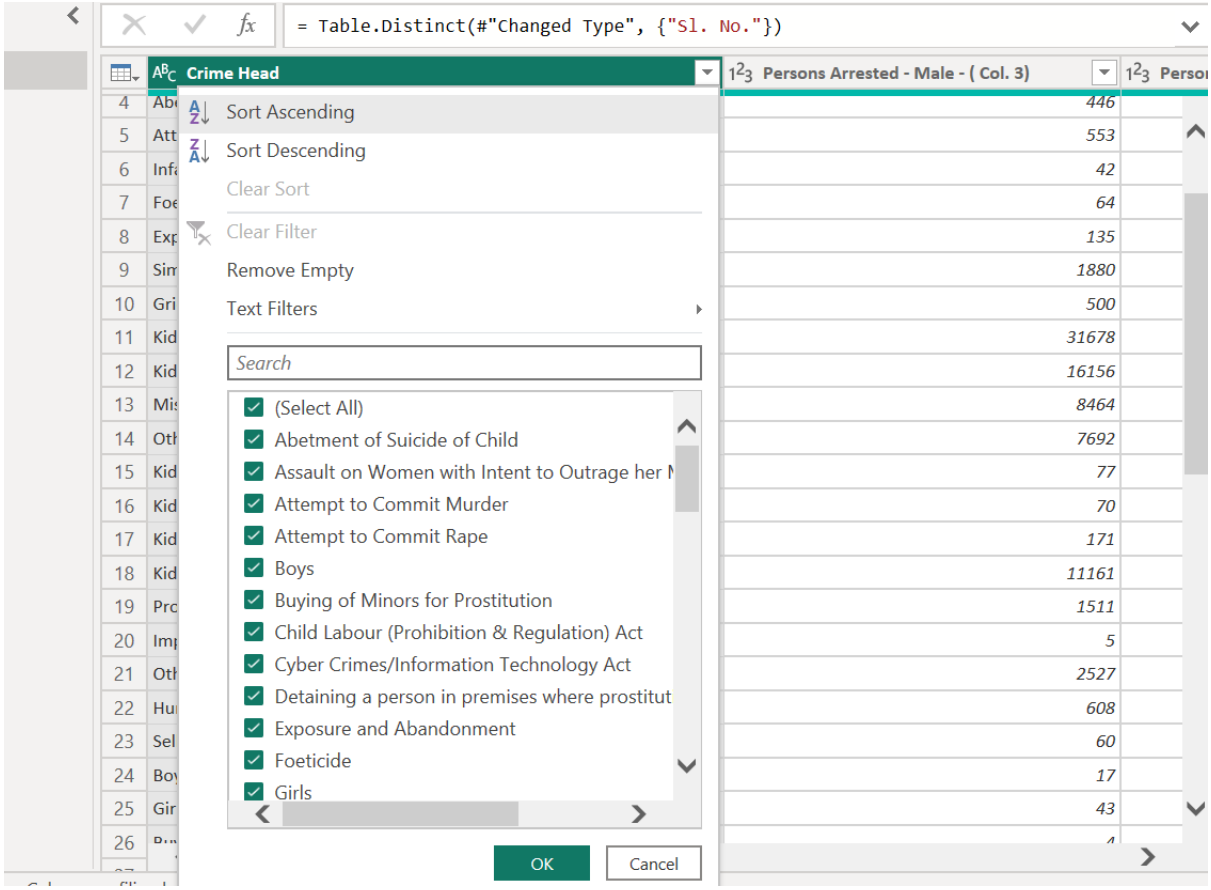
✅ **Task: Prepare a clean dataset for modelling**

Step1: Remove Duplicates



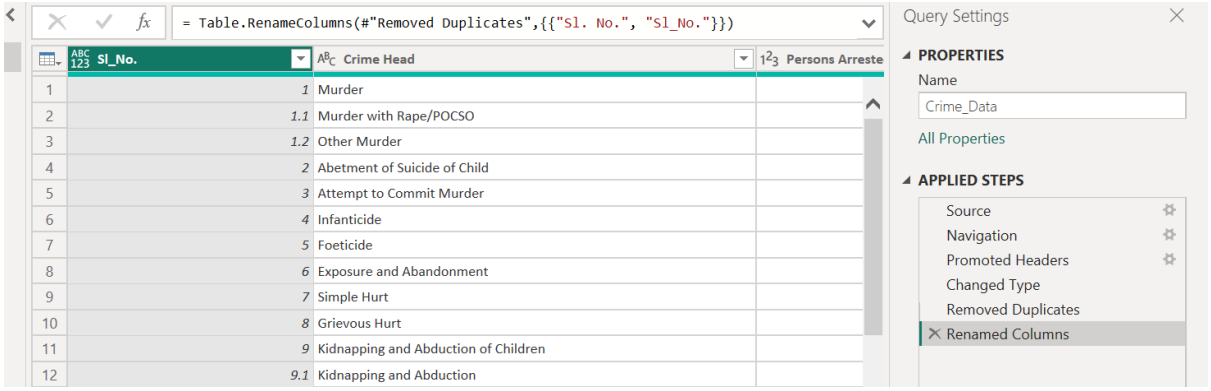
The dataset was opened in **Power Query Editor** using the **Transform Data** option in Power BI.
Duplicate records were checked using the **Remove Duplicates** option on the *Sl. No.* column to ensure each record is unique.

Step2: Check Missingvalues



The dataset was checked for missing or null values . No missing values were found in the dataset.

Step3: Standarising Columns



Step4:

Changed Sl_no Datatype from any to text and trim crimehead columns to avoid extra spaces and remove inconsistencies

Now the dataset is ready for Data modelling.
